INTRODUCTION

Housing tenure (i.e., the choice between renting or owning a home) is directly and pervasively related to income. As incomes increase, tenure shifts overwhelmingly to homeownership. About seven in ten households in Kentucky with incomes below \$5,000 are renters, whereas six of ten households with incomes between \$5,000 and \$15,000 are homeowners. The percentage of renters drops ten percentage points (and the homeownership rate increases by the same amount) for each additional \$10,000 increase in the income range, so that nine in ten households over \$35,000 are homeowners. Even at higher incomes, about 5 to 10 percent of the households remain in the renter market.

The split between renting and owning a home is also related to the age of the householder. Young singles and young couples are much more likely to be renters than older households, in part because they have lower incomes, but also because they tend to move more often and don't want the responsibility of a house. Recent declines in homeownership in Kentucky have been concentrated among younger households, who have had more difficulty in buying their first home during the 1980s than their predecessors in earlier decades. Consequently, there has been a significant increase in renter demand among persons below the age of 35. In addition, there is increasing evidence that low income renters are having to devote an extremely high share of their incomes to housing, leaving little for other necessities.

Given the strong relationship between income and tenure, the associated relationship between age and tenure, and the increased demand for rental housing in Kentucky, an assessment of rental housing demand is critically important. One key element in determining the rental housing needs in the state is an assessment of the incomes of renter households. Although renters are disproportionately low income, not all renters are poor. Among lower income renters, the degree of assistance that might be needed is determined in large part by income (and household size).

This report presents estimates of renter income distributions by income decile and by five income categories related to eligibility for housing assistance. The decile incomes identify the income range for ten equal groups of renters (i.e., 10% of the total number of renters is in each decile income range). Although there is a constant 10 percent of renters in each decile, the number of total renters varies from county to county, as do the incomes identifying the lower and upper bounds of each decile.

The decile income ranges were used to estimate the number of renters in each of five income categories related to eligibility for housing assistance. The median family incomes estimated by the U.S. Department of Housing and Urban Development were used to establish these categories. (The income thresholds for all of these categories vary according to household size as explained in the methodology section starting on page 6.) The first two categories (VERY LOW and LOW) are based on 50 and 80 percent of the median family income in the county or, for counties in Metropolitan

Statistical Areas (MSAs), the MSA median. These income limits were used to establish eligibility for most federal housing assistance programs. The next category, called LOW-MOD, represents the range between 80 and 100 percent of the median family income. The top two categories reflect the range between the median family income and the maximum income eligibility limit for the Kentucky Housing Corporation (KHC) (the MOD income category) and incomes above the KHC limit (MARKET), respectively.

Renter income estimates were prepared for all 120 counties of the state as a planning tool for housing programs. These estimates are presented here as Appendix A, Table A-1, Renter Household Distribution by Decile Income, and Appendix A, Table A-2, Renter Assistance Needs. In using these tables it is important to remember that they are based on income estimates, not direct measures of income for the year given. The estimates are derived from adjustments to 1980 Census data for renter incomes for each county and on estimates of renter households derived from household estimates for 1990 prepared by the Urban Research Institute (formerly the Urban Studies Center)¹. County level renter income distributions for 1980 were adjusted for 1980-1990 changes in renter incomes estimated at the state level. The distribution of renters by household size for each income category in Appendix A, Table A-2 is also based on state, rather than county level, data. Consequently, for all 120 counties there are approximately equal proportions of renters within an income category estimated to be a given household size.

Due caution must be exercised in using any estimate not based on direct measurement for a given year. However, the only alternative is to use unadjusted 1980 Census data, which are clearly out of date. Unless data from scientifically drawn samples of renter households are available for a county, these estimates will be the best available for planning housing assistance programs until data from the 1990 Census become available (probably not before 1992).

ANALYSIS OF RESULTS

An analysis of incomes of renters in Kentucky in 1980 and in 1988 highlights a growing disparity within the rental market between its higher income and lower income segments. Kentucky household incomes for the bottom 30 percent of the renter households increased by less than 33 percent during this period; incomes for the middle 30 percent of renter households increased by about 50 percent; and incomes for the top 40 percent of renter households approximately doubled. At the same time, rental housing costs (measured nationally) increased 63 percent. Consequently, the poorest segment of renters lost about half of their purchasing power for rental housing, the middle third of the rental market lost about 20 percent of their purchasing power, and the top third of the market increased its rental housing purchasing power by about 40 percent.

¹Koebel, C. T., 1989a. Institute, University of Louisville.

Kentucky Household Forecasts: The 1989 Edition.

Louisville: Urban Research

These trends point to a significant increase in hardship among low income renters, many of whom are dependent on transfer payments, part-time employment, and minimum wages. The Aid to Dependent Children payment for a family of three (mother and two children) in Kentucky went from \$197 in 1980 to \$207 in 1988, an increase of only 5 percent. Even with two additional 5 percent increases later in 1988 and in 1989, the cumulative increase through 1989 was only 16 percent, well below the increase in housing cost or other consumer goods. The loss of rental purchasing power forced most low income households to significantly increase the proportion of their income that goes to housing. Recent national estimates show that 45 percent of renters with incomes below the poverty level pay at least 70 percent of their income for housing and two-thirds devote at least half their income for housing. Even modest increases in rent levels in Kentucky would have strained the incomes of low income renters in the state, so it is highly probable that the national pattern on rent burden represents the situation in Kentucky.

The rental housing market has always been segmented between the market for newer, upscale units and the market for older, depreciated units. During the 1980s the upscale market of renters has become richer while the market for older, low priced rental housing has become poorer. Given the escalation of rental costs, the need for rental housing assistance among low income renters has increased significantly. Unfortunately, the supply of rental housing assistance--which increased dramatically during the 1970s--has remained virtually constant during the 1980s.

There were 77,352 housing units with rental assistance in Kentucky, providing shelter for about 5 percent of the households in the state.² At best, the available supply of assisted units can house only one-third of the renters eligible for such assistance, based on incomes below 80 percent of the median family income for the area (VERY LOW and LOW in Table 1). Even if assisted units were limited to renters with incomes below 50 percent of the median family income (VERY LOW in Table 1), the available supply would house less than 40 percent of the eligible renters.

One consequence of defining income categories relative to median family income is that the percentage distribution of renters in these categories is very similar across the state. Table 1 presents these distributions for the five regions of the state. (See Appendix B for map of Kentucky regions and counties.) The proportion of renters estimated in the VERY LOW income category is between 43 and 48 percent in each area. Between 15 and 19 percent of the renters are classified in the LOW income category, 8 percent in the LOW-MOD category, 9 percent in the MOD category, and 22 percent in the MARKET category.

The probability of being in the VERY LOW income category increases with family size from a low of 37 percent for two-person renter households to 50 percent for six-or-more-person renter households (Table 2). One-person renter households, particularly the elderly, are the exception to this relationship between household size and income. Households of the elderly have the highest probability of being in the VERY LOW income category (55%).

By comparing the number of assisted renter units with the number of eligible renter households (both the VERY LOW and the LOW income categories), the degree to which counties are relatively well served by assisted housing can be determined. Map 1 presents four categories of counties: those where assisted renter housing serves less than 20 percent of the eligible households; those with 20 to 29 percent served; those with 30 to 49 percent served; and those with 50 percent or more served. Each region of the state has counties with less than 20 percent of eligible renters served. However, these counties are somewhat clustered in eastern Kentucky. Western Kentucky has a greater share of counties with over 30 percent served. Based on this ratio, the counties with less than 20 percent of eligible renters served by housing assistance should be the focus for increased assisted housing, followed by those counties with 20 to 29 percent served. Only a few counties exceed the 50 percent level.

Map 1: Percentage of very low and low income renters served by assisted rental housing, 1990

Given the limited availability of assisted housing relative to the number of eligible renters, it should be no surprise that eligible households typically have to wait several months before they can move from a waiting list and to a rent assisted apartment. The statewide average length of time spent on waiting lists before being offered an assisted unit is 8.5 months.³ The units with the longest waiting periods are for 2-bedroom, handicapped accessible apartments (28 months), 2-bedroom elderly units (13.5 months), 2-bedroom family units (11.7 months), 3-bedroom family units (9.9 months), and 1-bedroom handicapped accessible units (9.3 months).

METHODOLOGY

Income Distributions

Decile income distributions were calculated for each county for 1980 based on data on renter income distributions from the 1980 Census of Population and Housing. The income ranges for renters available from the 1980 Census (Census of Population and Housing 1980: Summary Tape File 4, Table HB42) had sufficient detail to allow conversion to decile distributions with minimal estimation error. Seventeen income categories were available in the original data, in 12 \$2,500 increments through \$30,000, then two \$5,000 increments (\$30,000-34,999 and \$35,000-39,999), one \$10,000 increment (\$40,000-49,999), one \$25,000 increment (\$50,000-74,999), and an open ended final category (\$75,000 or more). Virtually every decile for every county fell below \$30,000, allowing very precise estimation of the 1980 decile ranges because the income distribution data for these incomes was in \$2,500 increments.

The 1980 decile ranges were converted to 1990 ranges (technically, incomes for the years 1979 and 1989 were being estimated) based on an analysis of income changes for renters in the state between 1980 and 1988, and extrapolated to 1990. Data on renter incomes from the 1980 and 1988 Current Population Surveys (CPS), as well as the 1980 Census of Population and Housing, were analyzed. The adjustment factors shown in Table 3 were calculated to convert 1980 renter incomes to 1990 incomes. These adjustment factors reflect significant loss in real incomes for renters with incomes below \$6,500 in 1980; moderate losses for renters with incomes between \$6,500 and \$12,299; and real gains in incomes for renters with incomes of \$12,300 and above in 1980. Consequently, these estimates reflect a pattern of lower income renters becoming relatively poorer while moderate income renters almost kept pace with inflation and the income for the top 20 percent of renters significantly increased.

The household size distribution (1, 2, 3, 4, 5, and 6+ persons) for each decile was estimated from the 1980 Census Public Use Microdata Sample (PUMS). There were no county level data available for estimating household size by income for renters, so state level data were used.

³Koebel, C. T., 1989b, *Ibid.*

Consequently, the household size distributions within an income category are virtually identical (as a percentage of all renters in the income category) for every county.

Table 3

Adjustment Factors to Convert 1980 Renter Incomes into 1990 Incomes, Kentucky

<u>1980 Income</u>	<u>Multiplier</u>
Less than \$4,750	1.21
\$4,750-6,499	1.33
\$6,500-8,274	1.43
\$8,275-9,999	1.49
\$10,000-12,299	1.53
\$12,300-15,249	1.73
\$15,250+	2.03

The matrix of income deciles and household sizes was then converted to the five income eligibility categories through linear interpolation. The five eligibility categories were established according to household size for each county based on the 50 percent, 80 percent, and 100 percent of median family income using the HUD income eligibility standards published for each county for 1989.⁴ These standards use the median family income for all nonmetropolitan counties as a minimum threshold. Because the median family income for 57 counties fell below this minimum, the minimum values were used to determine eligibility.

The maximum income threshold for KHC programs was used to define the MOD income category (between the median family income and the KHC maximum eligibility level) and the MARKET category (above the KHC level). The maximum income criterion for KHC is \$27,500 for a one-person household, with \$1,500 adjustments for each additional household member. The upper bound of the MOD category and the lower bound of the MARKET category are always the same value for each county. In a few metropolitan counties, the lower bound of the MOD category for certain household sizes exceeds the KHC limit. In these cases, it was impossible to define the remaining income categories, which are reported in Appendix A, Table A-2 as empty categories. (For example, the lower bound of the MOD category for three-person households is \$31,950 for Boone, Kenton, and Campbell counties. Similarly, this category is bounded by \$35,500 for four-person households, \$38,340 for five-person households, and \$41,180 for six+ person households. Each of these values exceeds the KHC limit for that household size.)

⁴Kentucky Housing Corporation, 1989. Kentucky Housing Corporation, Low-Income Housing Tax Credit Programs. Frankfort.

Renter Household Estimates

Estimates of renter households were derived from household estimates by age of the householder and type of household as published by the Urban Research Institute.¹ Renter proportions for each age and household type combination (e.g., the percentage of married couple families, householder aged 25-34 who are renters) were calculated from 1980 Census data (Census of Population and Housing 1980: Summary Tape File 2, Table A15). These renter proportions were applied to the 1990 household estimates to derive initial estimates of renters in each county. Since the percentage of renters in Kentucky increased between 1980 and 1988, estimates based on 1980 proportions would underestimate renter households.

Shifts in age-specific renter proportions were analyzed using data from the Current Population Survey (CPS). This analysis² isolates the overall increase in the percentage of renters to the increase in renter households among young adults. A similar analysis of shifts in renter proportions among household types (married couples, single parent families, and nonfamily households) found no evidence that the proportion of renters for these categories had increased. Consequently, the initial estimates of renters based on 1980 renter proportions were adjusted for shifts in renter proportions by age of householder.

Estimates of renters for five age groups (under 25, 25-34, 35-44, 45-64, 65+) were prepared for 1990 for the state as a whole, based on the percentage of renters estimated for each age group from the 1986, 1987, and 1988 CPS data. (The three years were pooled to increase reliability of the estimates.) Total renters in the state for each of the five age groups were estimated by applying the 1986-1988 CPS proportions to the 1990 household estimates for each age group. These estimates were then used as controls to adjust the sum of the county level estimates derived from the 1980 renter proportions. (The state control was divided by the sum of the counties for each age group and then each county estimate was multiplied by this ratio, which adjusts the county estimates so they sum to the state control.) This procedure assumes that county level shifts in the proportion of renters by age are adequately estimated by the shift in the state aggregate. Although this assumption is subject to error, it is likely to be less than the error resulting from using unadjusted 1980 renter proportions. The adjustments were relatively minor overall and mainly affected the 15-24 year old age group. It is likely that the market forces that increased the proportion of renters in this age group operated somewhat uniformly across the state.

The estimate of total renters in each county for 1990 was derived by summing the adjusted age-specific estimates. The estimated number of total renters was then applied to the renter decile

APPENDIX B

MAP OF KENTUCKY, REGIONS AND COUNTIES

Map of Kentucky, Regions and Counties

This map illustrates the geographical divisions of Kentucky into six major regions: North Central, Northeast, Southeast, South Central, Western, and Bluegrass. It also delineates the boundaries of all 120 counties. Key geographical features are labeled, including the Kentucky River, Green River, Barren River, and Lake Cumberland. The map is titled "Map of Kentucky, Regions and Counties" at the top. The regions are labeled as follows: North Central (top left), Northeast (top right), Southeast (bottom right), South Central (bottom), Western (bottom left), and Bluegrass (top center). The Kentucky River is shown flowing through the eastern part of the state. The Green River is located in the western part. The Barren River is in the south-central part. Lake Cumberland is in the south-central part. The map also shows the location of the Kentucky State Capitol in Frankfort. The counties are labeled with their names, such as Boone, Mingo, Wayne, Lincoln, and others. The map is a black and white line drawing.

South Central
